

The VSP “Registry” is the foundation of the Secure Data Release Model; it is a repository of secure, background checked Vehicle Security Professionals (VSP). A VSP is an automotive locksmith or repair technician who specializes in services that require use of security-related service information. These services include immobilizer resets, component replacements that require initialization of security systems and creation/registration of high security keys. Locksmiths and technicians who have a need to access automaker security-related service information can apply for inclusion in the Registry.
